

# Unistal to recruit more than 300 channel partners

News Desk [ Wednesday, March 14, 2007 ]

New Delhi

Unistal Systems Pvt. Ltd., provider of data recovery and security products and services today announced that it is recruiting more than 300 national and international channel partners for its recently launched 'data recovery over Internet services.

These services are being extended to customers by the Unistal channel partners through [www.idatacare.com](http://www.idatacare.com) portal. Customers, wherever they may be across the globe, can bring their disk media to any of the authorized Unistal channel partner for data recovery. The channel partner connects the hard disk to proprietary connectivity tools developed by Unistal (over a static IP). The experienced data recovery engineers based at the Unistal's Central Recovery Lab (CRL) at New Delhi then perform the data recovery or repair process on the hard disk online. As and when need arises, channel partners can conduct a live chat with experts at CRL and resolve all

technical issues instantly. It circumvents the need to send the hard disk to Unistal's master labs. What's more, customers can even track their data recovery process online.

Unistal's channel partners for this unique online service will help the customer recover data even if the partition is corrupted; hard disk has been accidentally formatted; data has been deleted even from the recycle bin; in case of virus attacks; bad media; FAT or VFAT errors; data loss owing to corruption of OS; mail box corruption; address book corruption; missing files and directories; database corruption; broken hard disks; RAID system failure; server corruptions and deletions; damages due to electrical shock; loss due to natural calamities like flood, fire etc; sabotage; power supply burn out or failure; and corruption of files.

Unistal's online recovery services are available for different types of media and operating systems.

According to Alok Gupta, Director-Marketing, Unistal Systems, "This unique service besides ensuring best possible

results for customers in an efficient and convenient manner, enables us to expand our operations and offer cutting-edge data recovery services across the globe in a short time. We are desirous of tying up with right channel partners and building an extensive network in all geographies."

Unistal's engineers have developed proprietary methods of recovering data from heavily bad sectorized disks, even those that Windows rejects to show as a drive. These methods have also done wonders in accessing those disks that are not recognized by the system setup.

Hardware and software tools from Unistal allow recovery of crashed IDE (ATA), SCSI, and SATA drive when it is knocking, is not recognized by BIOS or does not rotate spindle. Unistal's indigenous tools enable diagnosis of the exact cause of failure and prepare the drive for data recovery. This allows for problem solving of modules in the controller or the disk physical geometry etc.
